Professional Summary

High-agency software engineer with 2+ years at Careem (an Uber company) building payment and billing systems, microservices, frontends and data-heavy products used by millions of riders. Proven record of shipping revenue-critical features, fixing production outages, and leading delivery of 5 new product lines in 6 months. Strong in Golang, TypeScript, Java, Python, and event-driven architecture.

Professional Experience

Software Engineer II

CAREEM

Remote, Pakistan

June 2024 - Present

Bikes & Tenants team (Golang, Spring Boot, NextJS, MySQL, Kafka)

- Reduced silent payment and refund failures to zero by rebuilding the trip billing flow as an event-driven system that guarantees every charge and refund completes, even across service restarts; on track to lift payment success rate by 5+ points in Dubai to 97% and 10 points in Madinah to 82% at full rollout.
- Eliminated recurring production database outages by fixing slow queries on tables with 7.5M+ rows, improving response times by up to 42x and cutting customer-facing latency in half.
- Owned the migration of bike subscriptions from a third-party vendor to an in-house billing platform, bringing recurring payments and pricing fully in-house with zero downtime for existing subscribers.
- Designed and launched Pay-As-You-Go billing for group rides, a new revenue stream, including secure card pre-authorization and automatic retries that recover failed payments without user action.
- Led backend delivery of 5 new tenant service lines (including Lab Test and Pest Control) in under 6 months, each shipped on time with full payment and data integration.
- Migrated terabytes of customer data across home services categories with zero downtime and no data loss.
- Built an internal operator dashboard used daily by operations teams to manage vehicles, pricing zones, and stations; drove its adoption by consistently shipping proactive fixes and UX improvements well beyond the initial scope.
- Strengthened release reliability by automating the release pipeline and expanding end-to-end test coverage across payment, subscription, and trip services.

Localization team (Python, FastAPI)

- Built the translation infrastructure behind an LLM-powered localization pipeline, cutting manual translation effort for app-wide releases across multiple languages.

Teaching Assistant

INSTITUTE OF BUSINESS ADMINISTRATION

Karachi, Pakistan

Spring 2023 - 16 months

- Held tutorials and office hours to clarify difficult topics in Theory of Computation and Algorithm Design courses.
- Provided tailored feedback on assignments for 160+ students, improving their grasp of key concepts.

Skills

Programming Languages Golang, Python, JavaScript/TypeScript, Rust, Java

Backend & Data Microservices, REST APIs, Spring Boot, MySQL, Kafka, Event-Driven Architecture

Frontend React, Next.js, TypeScript

Tools & Platforms Docker, Linux, Git, AWS
